Root Cause of Loss Determination Based Upon an Evaluation of the Current Powered Industrial Truck Risk Management System at Company XYZ 2014

powered industrial trucks pits have become a necessary means of transporting goods within various organizations throughout the world although the use of this form of powered equipment provides many benefits due to the decreased need for manpower and increased timeliness such devices are not without detriments the purpose of this study was to determine the root cause of pit related losses based upon an evaluation of the current pit risk management system in place at company xyz the evaluation consisted of a data analysis assessing four years of reported pit related incidents as well as a risk assessment which evaluated several components of the current pit management program in place the findings of the data analysis indicated a correlation between the age of the pit operator and frequency of pit related incidents the risk assessment identified a deficiency in refresher training for all pit operators as well as enforcement of pit operation job requirements based upon the results of the study the researcher recommended that company xyz consider implementing a comprehensive refresher training program to include pit operator knowledge and physical fitness evaluations it was also recommended that the organization consider implementing a behavior based safety program

An Assessment of the Risk of Transporting Propane by Truck and Train 1980

industrial development is essential to improvement of the standard of living in all countries in a given region old and new plants processes and technologies have to coexist technological penetration and substitution processes are generally taking place they are entirely dynamic and this trend is going to stay like this people's health and the environment can be affected directly or indirectly by routine waste discharges or by accidents a series of recent major industrial accidents and the effect of pollution highlighted once again the need for better management of routine and accidental risks moreover the existence of natural hazards complicate even more the situation in any given region managing the hazards of modern technological systems has become a key activity in highly industrialized countries decision makers are often confronted with complex issues concerning economic and social development industrialization and associated infrastructure needs population and land use planning such issues have to be addressed in such a way that ensures that public health will not be disrupted or substantially degraded

Risk Management for Dangerous Goods 1989

risk assessment has become the backbone of health and safety management in the uk and elsewhere employers have a legal duty to prove that risk assessments have been carried out and precautions have been implemented as far as reasonably practicable mike bateman demystifies the risk assessment process and how it relates to uk legislation he covers both the general techniques and the assessment of specific risks such as hazardous substances coshh noise manual handling dse workstations ppe fire asbestos and work at height the book is designed to be user friendly rather than overly legalistic or academic and tells the reader how to go about risk assessment not just what the legislation requires it contains numerous checklists forms and worked examples for a variety of hazards and industries this edition has been updated to take into account the impact of the following regulations on risk assessments work at height

Assessment of Accident Risk During Haulage Truck and Power Shovel Maintenance and Recommendations for Improved Safety 1990

introduces risk assessment with key theories proven methods and state of the art applications risk assessment theory methods and applications remains one of the few textbooks to address current risk analysis and risk assessment with an emphasis on the possibility of sudden major accidents across various areas of practice from machinery and manufacturing processes to nuclear power plants and transportation systems updated to align with iso 31000 and other amended standards this all new 2nd edition discusses the main ideas

and techniques for assessing risk today the book begins with an introduction of risk analysis assessment and management and includes a new section on the history of risk analysis it covers hazards and threats how to measure and evaluate risk and risk management it also adds new sections on risk governance and risk informed decision making combining accident theories and criteria for evaluating data sources and subjective probabilities the risk assessment process is covered as are how to establish context planning and preparing and identification analysis and evaluation of risk risk assessment also offers new coverage of safe job analysis and semi quantitative methods and it discusses barrier management and hra methods for offshore application finally it looks at dynamic risk analysis security and life cycle use of risk serves as a practical and modern guide to the current applications of risk analysis and assessment supports key standards and supplements legislation related to risk analysis updated and revised to align with iso 31000 risk management and other new standards and includes new chapters on security dynamic risk analysis as well as life cycle use of risk analysis provides in depth coverage on hazard identification methodologically outlining the steps for use of checklists conducting preliminary hazard analysis and job safety analysis presents new coverage on the history of risk analysis criteria for evaluating data sources risk informed decision making subjective probabilities semi quantitative methods and barrier management contains more applications and examples new and revised problems throughout and detailed appendices that outline key terms and acronyms supplemented with a book companion website containing solutions to problems presentation material and an instructor manual risk assessment theory methods and applications second edition is ideal for courses on risk analysis risk assessment and systems engineering at the upper undergraduate and graduate levels it is also an excellent reference and resource for engineers researchers consultants and practitioners who carry out risk assessment techniques in their everyday work

Guidelines for Chemical Transportation Safety, Security, and Risk Management 2008-09-02

risk assessment is the key to successful management of health and safety at work risk assessments are carried out in order to quantify and evaluate the significance of workplace hazards so that appropriate control measures can be put in place usually a written record of the assessment is required detailing the following information the hazards and how much risk is associated the risk with appropriate control measures deadlines to follow up the risk assessment to ensure the risk is managed failure to carry out risk assessments punishable by law is often due to lack of a suitable risk assessment system toley s risk assessment workbook utilities provides that system both in the form of key background information on how to carry out a risk assessment understanding relevant legislation and regulations but most importantly by providing checklists highlighting key industry specific hazards and control measures questionnaires highlighting key questions the risk assessor should ask when analysing the risk posed by the hazard action plans to ensure the risk assessment is followed up and completed the workbook offers a practical risk assessment system it shows you how to comply with the law and gives you the

foundations of a logical procedure that can be understood easily put into placed quickly where necessary and adapted to your organisation s needs toley s risk assessment workbooks is a series of practical workbooks providing you with all the information you need to conduct risk assessments in industry specific areas including manufacturing retail leisure education offices and construction a special risk assessment workbook on stress has also been developed in order to facilitate management of this issue which is of key concern to all organisations

the risk of shipping propane is discussed and the risk assessment methodology is summarized the risk assessment model has been constructed as a series of separate analysis steps to allow the risk to be readily reevaluated as additional data becomes available or as postulated system characteristics change the transportation system and accident environment the responses of the shipping system to forces in transportation accidents and release sequences are evaluated to determine both the likelihood and possible consequences of a release supportive data and analyses are given in the appendices the risk assessment results are related to the year 1985 to allow a comparison with other reports in this series based on the information presented accidents involving tank truck shipments of propane will be expected to occur at a rate of 320 every year accidents involving bobtails would be expected at a rate of 250 every year train accidents involving propane shipments would be expected to occur at a rate of about 60 every year a release of any amount of material from propane trucks under both normal transportation and transport accident conditions is to be expected at a rate of about 110 per year releases from propane rail tank cars would occur about 40 times a year however only those releases that occur during a transportation accident or involve a major tank defect will include sufficient propane to present the potential for danger to the public these significant releases can be expected at the lower rate of about fourteen events per year for truck transport and about one event every two years for rail tank car transport the estimated number of public fatalities resulting from these significant releases in 1985 is fifteen about eleven fatalities per year result from tank truck operation and approximately half a death per year stems from the movement of propane in rail tank cars

Tolley's Practical Risk Assessment Handbook 2006

this study presents a risk analysis of goods movement along the transportation corridors of los angeles county focusing on i 710 and i 10 and using geographic information systems gis in the analysis truck and passenger car accidents are compared and the accident rates are estimated segments with a high potential for accidents are identified and the risk associated with the transportation of goods is calculated using results from the analysis high risk locations are identified it is intended that the study would serve to further the development of risk models used for estimating risks associated with the transportation of goods and develop policy measures related to goods movement in

Safety Audit of the Bulk Liquid Storage Terminals at Coode Island, Australia--Task 3 1991

in the last few years logistics has become a strategic factor for development and competition in fact research and development activities have traditionally faced the management of supply chain and international transport focussing on two main aspects speed and efficiency however several vulnerabilities have recently been highlighted under a safety and security viewpoint the weakness of the logistic chains has become more evident with the beginning of the new millennium terrorist attacks such as the 11th of september 2001 in the usa have caused the introduction of new rules and procedures which affect the overall logistics showing the vulnerability of the global economy so nowadays it would appear anachronistic to carry out an exhaustive research activity on the supply chain with no relation to the various typologies of risk which may affect it this book aims to effectively represent the current status of research on dangerous goods transport

Motor Carrier Safety 2007

logistics is a complex industry that exposes employees to a whole variety of risks these include not only accidents on the road and deaths and injuries resulting from unsafe use of forklifts but also the consequences of poor fire safety long term health risks due to poor manual handling technique and problems relating to mental health many thousands of incidents are recorded every year this book examines each aspect of health and safety in turn with a focus on warehousing and transportation health and safety in logistics informs managers about potential hazards found in the industry and explains in detail how they can make the workplace as safe as possible

the subject of this volume uncertainties in risk assessment and management reflects an important theme in health safety and environmental decision making most technological hazards are characterized by substantial uncertainty recent examples include nuclear waste disposal acid rain asbestos in schools carcinogens in food and hazardous waste dealing with such uncertainty is arguably the most difficult and challenging task facing risk assessors and managers today four primary sources of uncertainty in risk assessment and management can be identified 1 uncertainties about definitions 2 uncertainties about scientific facts 3 uncertainties about risk perceptions and attitudes and 4 uncertainties about values uncertainties about definitions derive primarily from disagreements about the meaning and interpretation of key concepts such as probability uncertainties about scientific facts derive primarily from disagreements about failure modes the probability and magnitude of adverse health or environmental consequences cause and effect relationships dose response relationships and exposure patterns uncertainties about risk perceptions and attitudes derive primarily from disagreements about what constitutes a significant or acceptable level of risk uncertainties about values derive primarily from disagreements about the desirability or worth of alternative risk management actions or consequences the papers in this volume address each of these sources of uncertainty from a variety of perspectives reflecting the broad scope of risk assessment and risk management research the papers include contributions from safety engineers epidemiologists toxicologists chemists biostatisticians biologists decision analysts economists psychologists political scientists sociologists ethicists and lawyers

Effective Commercial Truck and Bus Safety Management Techniques 2003

leon n moses in june 1991 the transportation center at northwestern university sponsored hazmat transport 91 a national conference on the transportation of hazardous materials and wastes the faculty associated with the center were aware that there had been many professional industrial and government conferences and meetings on the subject however they believed that the unique capacity of the transportation center to bring together leaders from industry and government as well as leading scholars from economics law engineering psychology and sociology who have done research on the problems associated with the transportation of hazardous materials and wastes hazmats could produce a set of integrated insights and understandings that would go well beyond those of previous conferences the papers that make up this volume were all delivered at hazmat transport 91 from a legislative point of view they tend to deal with issues associated with the hazardous materials transportation act of 1975 hmta the original act passed to regulate the transportation of hazardous materials and the hazardous materials transportation uniform safety act of 1990 hmtusa there were talks and papers presented at the conference that focused on other recent legislation and transportation issues with which hmtusa does not deal the conference proceedings volume also had discussions and papers on significant managerial and regulatory issues that could not be included in this volume because of constraints on its size therefore this essay is made up of three parts
