causal uncertainty is a wide spread phenomenon courts are often unable to determine whether a defendant s tortious conduct was a factual cause of a plaintiff s harm yet sometimes courts can determine the probability that the defendant caused the plaintiff s harm although often there is considerable variance in the probability estimate based on the available evidence the conventional way to cope with this uncertainty has been to apply the evidentiary rule of standard of proof the application of this all or nothing rule can lead to unfairness by absolving defendants who acted tortiously and may also create undesirable incentives that result in greater wrongful conduct and injustice to victims some courts have decided that this no liability outcome is undesirable they have adopted rules of proportional liability that compensate plaintiffs according to the probability that their harm was caused by the defendant s tortious conduct in 2005 the principles of european tort law petl made a breakthrough in this regard by embracing rules of proportional liability this project building on petl endeavours to make further inquiries into the desirable scope of proportional liability and to offer a more detailed view of its meaning implications and ramifications

why do we steal this question has confounded everyone from parents to judges

teachers to psychologists economists to more than a few moral thinkers stealing can be a result of deprivation of envy or of a desire for power and influence an act of theft can also bring forth someone's hidden traits paradoxically proving beneficial to their personal development robert tyminski explores the many dimensions of stealing and in particular how they relate to a subtle balance of loss versus gain that operates in all of us our natural aversion to loss can lead to extreme actions as a means to acquire what we may not be able to obtain through time work or money tyminski uses the myth of jason medea and the golden fleece to explore the dilemmas involved in such situations and demonstrate the timelessness of theft as fundamentally human the psychology of theft and loss incorporates jungian and psychoanalytic theories as well as more recent cognitive research findings to deepen our appreciation for the complexity of human motivations when it comes to stealing culminating in consideration of the idea of a perpetually present inner thief combining case studies jungian theory and analysis of many different types of stealing including robbery kidnapping plagiarism and technotheft the psychology of theft and loss is a fascinating study which will appeal to psychoanalysts psychologists psychiatrists social workers family therapists and students

the amount of data in medical databases doubles every 20 months and physicians are at a loss to analyze them also traditional methods of data analysis have difficulty to identify outliers and patterns in big data and data with multiple exposure outcome variables and analysis rules for surveys and questionnaires currently common methods of data collection are essentially missing obviously it is time that medical and health professionals mastered their reluctance to use machine learning and the current 100 page cookbook should be helpful to that aim it covers in a condensed form the subjects reviewed in the 750 page three volume textbook by the same authors entitled machine learning in medicine i iii ed by springer heidelberg germany 2013 and was written as a hand hold presentation and must read publication it was written not only to investigators and students in the fields but also to jaded clinicians new to the methods and lacking time to read the entire textbooks general purposes and scientific questions of the methods are only briefly mentioned but full attention is given to the technical details the two authors a statistician and current president of the international association of biostatistics and a clinician and past president of the american college of angiology provide plenty of step by step analyses from their own research and data files for self assessment are available at extras springer com from their experience the authors demonstrate that

machine learning performs sometimes better than traditional statistics does machine learning may have little options for adjusting confounding and interaction but you can add propensity scores and interaction variables to almost any machine learning method
